

Make it Yours

package.json

Your plugin is just a Node.js module. Every Node.js modules needs a `package.json` file with some meta information about the module.

The plugin-template already included one, but you have to edit it so that it contains the information about your plugin like name, author, version, ...

You can read about it in the [npm package.json documentation](#).

Adding package dependencies

- You can add other package dependencies by running `npm install something --save`.
With the `--save` option npm will auto add the installed dependency in your `package.json`
- You can always install all dependencies in the package.json with `npm install`
